

How to configure the dynaTrace Software Client

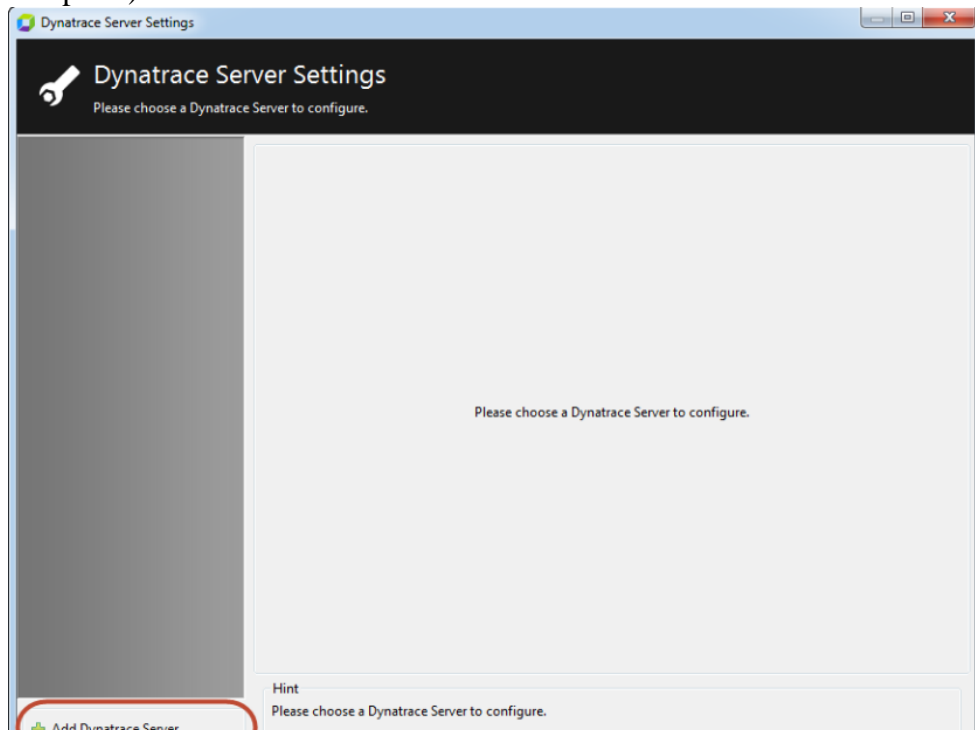

You need the **dynaTrace Client 6.5** software installed on your computer.

The dynaTrace Client is not backwards-compatible, so you must use version 6.5 to access this server. If you don't have dynaTrace Client 6.5, [request it from the UHG AppStore](#).

1. Start the **dynaTrace Client 6.5**
2. When prompted for a username/password, use your MS credentials
3. Select **Settings -> dynaTrace Servers** from the dynaTrace Client's menu

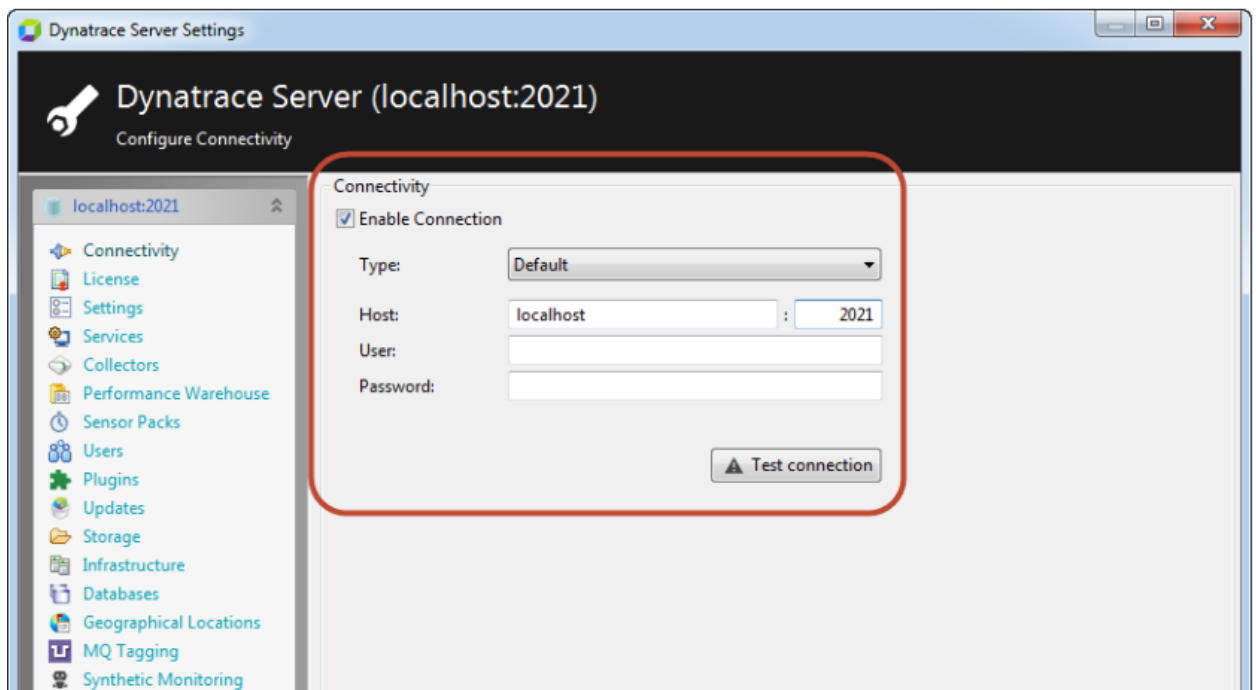

4. Click the **Add dynaTrace Server** button under the server list (yours may be empty at this point)

5. Fill in the fields in the Connectivity section of the form using the following values:

Host:	dynatrace-prod-s2.uhc.com	:	2021
User:	dsachd1		
Password:	[Your MS Credentials Password]		

6. Click the **Test Connection** button to confirm that you have entered the fields correctly.
7. Once all the test has completed successfully, click the OK button to close the dialog and begin working in dynaTrace.
